Introduction to Embedded Systems

Final Project: Progress Report

Write a 2-3 page report, single-spaced, 11pt Times New Roman font, describing the following:

1. Title of your project
2. List team member names, email addresses and student IDs
3. Motivation for your project – should be a convincing story about the need/goal of your project.
4. Describe what you plan to deliver and highlight any changes since your approved proposal
5. Related work
    a. Discuss what others have already accomplished in this area (this can include published academic papers or commercial products or other people's projects).
    b. Highlight what is interesting and new in your particular implementation relative to other previous works
6. Development progress
    a. List HW components you are working with and the status of your HW development. Discuss any changes and issues that may have arisen in the HW area since the proposal.
    b. List SW frameworks that you use, the SW you plan to design and the status of that implementation. Discuss any changes and issues that have arisen in the SW area.
7. Experimental section (be as detailed and explicit as possible!)
    a. Describe metrics of success (e.g. power consumption decreased by 30%)
    b. Outline experiments you already did, and discuss results to date
8. Describe what we will see in the final project demo & what remains to be done by the final project report.

One student from each team should turn the proposal into Gradescope, in .pdf format, named as follows: <userID1>_<userID2>_progress.pdf; for example: "tajana_xiaofan_progress.pdf
