CSE237A

Final Project: Proposal

For the final project, you will work in teams of 2 on a topic of your choice. The topic needs to be in the area of embedded systems and has to involve both hardware (HW) and software (SW). Your proposal should be approved by the teaching team (professor and TA). You will be expected to turn in the proposal, mid-project report, do a final project demo in class and turn in the final report. The quality of the final report should mimic a shorter conference paper.

Write a 1-2 page proposal, single-spaced, 11pt Times New Roman font, describing the following:

1. Title of your project
2. List team members names, email addresses, and student IDs
3. What you plan to do, why & what is challenging about it (i.e., why should it be a grad level class project), list existing related research papers/demos if applicable
4. List HW components you will interface with and, if applicable, where you will get them from
5. Describe the SW you will implement
6. Metrics of success (e.g., power consumption decreased by 30%)
7. Experiments you will run and the results you expect
8. Deliverables by the mid-project report
9. Describe the final project demo & what you will report in the final project report

One student from each team should turn the proposal into Gradescope, in .pdf format, named as follows: <userID1>_<userID2>_proposal.pdf; for example: "tajana_xiaofan_proposal.pdf
